Lessons 1&2

The Journey Begins Decimals to the Thousandths Place

Remember

Decimal Fraction

It is a number that represents a value less than 1, but greater than 0.

The whole one can be divided into

Ten equal
parts

Each part is called
one tenth.

$$0.1 = \frac{1}{10}$$

One hundred
equal parts

Each part is called
one hundredth.

$$0.01 = \frac{1}{100}$$

One thousand
equal parts

Each part is called
one thousandth.

$$0.001 = \frac{1}{1,000}$$

Note that: In decimals, zeros can be added to the **right** of the last non-zero digit without changing the value of the number.

0.1
(One tenth)

0.10
(Ten hundredths)

0.100
(One hundred thousandths)

Also: $0.2 = 0.20 = 0.200$, $0.3 = 0.30 = 0.300$, ... and so on.

Decimal Number

- It is a number that represents a value greater than 1.
- The decimal number consists of **two** parts separated by a **decimal point**.

Whole number part (integer)

To the **left** of the decimal point

Decimal parts (decimal fraction)

To the **right** of the decimal point

357 . 94

It's read as: Three hundred fifty-seven **and** ninety-four hundredths.

Reading Numbers from One Milliard to Thousandths

Learn To read any decimal:

- Divide the whole number into numerical groups according to the place value table.
- Read the number from the **left**, each number group is followed by its name.
- Read the decimal parts followed by the name of the **last decimal part** on the **right**.

Whole Number										Decimal Point	Decimals		
Milliards	Millions			Thousands			Ones				Tenths	Hundredths	Thousandths
Ones	Hundreds	Tens	Ones	Hundreds	Tens	Ones	Hundreds	Tens	Ones				
6	0	0	8	0	4	5	1	7	0				
6 milliard	8 million			45 thousand			170			17 hundredth			

The previous number (6,008,045,170.17) is read as:

Six milliard, eight million, forty-five thousand, one hundred seventy **and** seventeen hundredths.

► **Note the reading of the following numbers:**

b	6,500,739.7
c	9,009.009
d	37,000,157.128
e	80,218.039

Notes

To form the **greatest** and **smallest** decimals from given digits:

- **Greatest Number** → Arrange the digits from left to right, from the **greatest** to the **smallest**.
- **Smallest Number** → Arrange the digits from left to right, from the **smallest** to the **greatest**.

Then, put the decimal point according to the number of decimal parts requested in the question.

Example: Use the digits shown to form the **greatest** and **smallest** decimals possible:

a (6 , 8 , 3 , 2 , 7 , 5):

	Up to the Tenths Place	Up to the Hundredths Place	Up to the Thousandths Place
Greatest Number	87,653.2	8,765.32	876.532
Smallest Number	23,567.8	2,356.78	235.678

b (9 , 3 , 8 , 5 , 2):

	Up to the Tenths Place	Up to the Hundredths Place	Up to the Thousandths Place
Greatest Number	9,850.2	985.02	98.502
Smallest Number	2,058.9	205.89	20.589

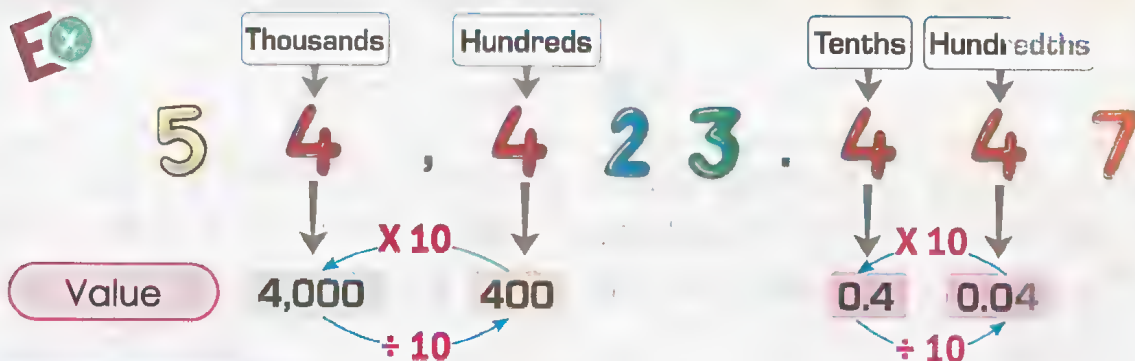

5 Make up the **greatest** and **smallest** decimals of the given digits:

	Digits	The greatest number up to the			The smallest number up to the		
		Tenths	Hundredths	Thousandths	Tenths	Hundredths	Thousandths
a	6, 5, 7, 8, 3, 2, 4						
b	8, 3, 0, 7, 4						
c	3, 2, 8, 7, 3, 5, 0, 7						
d	9, 3, 2, 5, 3, 7, 4						
e	6, 2, 4, 3						

Lessons
3&4

 Place Value Shuffle
Composing and Decomposing Decimals

Learn The value of the digit changes within the number by changing its place:

From above **The value of the digit:**

- Increases by 10 times ($\times 10$) as it moves to the **left**.
- Decreases by 10 times ($\div 10$) as it moves to the **right**.

Learn Using the place value charts to solve multiplying and dividing by 10 problems

Example (1): Use the place value chart to solve the following problem: 75.4×10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
				7	5	.	4		
			7	5	4				

- The value of 7 increased when multiplying by 10 from 70 to 700
- The value of 5 increased when multiplying by 10 from 5 to 50
- The value of 4 increased when multiplying by 10 from 0.4 to 4

Therefore:

The value of the whole number 75.4 increased when multiplying by 10 from 75.4 to 754, so $75.4 \times 10 = 754$.

Example (2): Use the place value chart to solve the following problem: $75.4 \div 10 = 7.54$

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
				7	5	.	4		
					7	.	5	4	

- The value of **7** decreased when dividing by 10 from **70** to **7**
- The value of **5** decreased when dividing by 10 from **5** to **0.5**
- The value of **4** decreased when dividing by 10 from **0.4** to **0.04**

Therefore:

75.4 754

The value of the whole number **75.4** decreased by a factor of **10** from **75.4** to **7.54**, so $75.4 \div 10 = 7.54$.

Notes

- When multiplying by **10** → Move all digits of the number **one** place to the **left**.
- When dividing by **10** → Move all digits of the number **one** place to the **right**.

1 Use the place value charts to solve the following problems.

Fill in the blanks to show how the value of each digit has changed:

a 386×10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths

- The value of (increased/decreased) when multiplying by **10** from to
- The value of (increased/decreased) when multiplying by **10** from to
- The value of (increased/decreased) when multiplying by **10** from to
- Therefore, the value of the whole number (increased/decreased) when multiplying by **10** from to, so $386 \times 10 = \dots\dots\dots$

b 2.5×10

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
						.

- The value of (increased/decreased) when multiplying by **10** from to
- The value of (increased/decreased) when multiplying by **10** from to
- Therefore, the value of the whole number (increased/decreased) when multiplying by **10** from to, so $2.5 \times 10 = \dots\dots\dots$.

c $915 \div 10$

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
						.

- The value of (increased/decreased) when dividing by **10** from to
- The value of (increased/decreased) when dividing by **10** from to
- The value of (increased/decreased) when dividing by **10** from to
- Therefore, the value of the whole number (increased/decreased) when dividing by **10** from to, so $915 \div 10 = \dots\dots\dots$.

d $8.7 \div 10$

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
							.		
						.			

- The value of (increased/decreased) when dividing by 10 from to
- The value of (increased/decreased) when dividing by 10 from to
- Therefore, the value of the whole number (increased/decreased) when dividing by 10 from to , so $8.7 \div 10 =$

Decomposing Decimal Numbers in Expanded Forms

Learn Extended form is used to decompose decimals.

Note the following:

- a $0.025 = 0.02 + 0.005$ b $0.25 = 0.2 + 0.05$
- c $4721.7 = 4,000 + 700 + 20 + 1 + 0.7$ d $472.17 = 400 + 70 + 2 + 0.1 + 0.07$
- e $47.217 = 40 + 7 + 0.2 + 0.01 + 0.007$

Note

Decimals can be decomposed in several ways, as in the following example:

3 Decompose the following numbers:

- a $34.527 =$ (1st Way: Expanded Form)
 $=$ (2nd Way)
 $=$ (3rd Way)
- b $21.045 =$ (1st Way: Expanded Form)

Rounding Strategies

First: The Midpoint Strategy:

Example: Round each of the following numbers:

a 24.7 (To the nearest whole number)

- The number 24.7 is located between the numbers 24.0 and 25.0.
- The midpoint between the two numbers is 24.5.
- 24.7 is closer to 25.0.

So, $24.7 \approx 25$ (To the nearest whole number)

b 3.74 (To the nearest Tenth)

- The number 3.74 is located between the numbers 3.70 and 3.80.
- The midpoint between the two numbers is 3.75.
- 3.74 is closer to 3.70.

So, $3.74 \approx 3.7$ (To the nearest Tenth)

c 45.698 (To the nearest Hundredth)

- The number **45.698** is located between the numbers **45.690** and **45.700**.
- The midpoint between the two numbers is **45.695**.
- **45.698** is closer to **45.700**.

So, $45.698 \approx 45.70$ (To the nearest Hundredth)

d 2.3175 (To the nearest Thousandth)

- The number **2.3175** is located between the numbers **2.3170** and **2.3180**.
- The midpoint between the two numbers is **2.3175**.
- **2.3175** is located at the midpoint.

So, $2.3175 \approx 2.318$ (To the nearest Thousandth)

Second: Rounding Rule Strategy:

1. Select the digit in the place to be rounded.
2. Replace the digits in the places that precede the previously selected digit with **zeros**.
3. Look at the digit in the place preceding the place to be rounded directly.

If this digit is **0, 1, 2, 3, or 4**,
the number of the specified
place remains **unchanged**.

If this digit is **5, 6, 7, 8 or 9**,
we **add 1** to the number of
the specified place.

Example: Round the following numbers to the nearest:

a

$$\begin{array}{r} 9.6\overset{+1}{\underset{\curvearrowright}{7}}5 \\ \downarrow \downarrow \downarrow \downarrow \\ 10.000 \\ 9.675 \approx 10 \end{array}$$

(Whole number)

b

$$\begin{array}{r} 6.\overset{\curvearrowright}{2}4 \\ \downarrow \downarrow \downarrow \\ 6.20 \\ 6.24 \approx 6.2 \end{array}$$

(Tenth)

c

$$\begin{array}{r} 56.8\overset{+1}{\underset{\curvearrowright}{3}}9 \\ \downarrow \downarrow \downarrow \downarrow \downarrow \\ 56.840 \\ 56.839 \approx 56.84 \end{array}$$

(Hundredth)

d

$$\begin{array}{r} 2.35\overset{+1}{\underset{\curvearrowright}{6}}5 \\ \downarrow \downarrow \downarrow \downarrow \downarrow \\ 2.3570 \\ 2.3565 \approx 2.357 \end{array}$$

(Thousandth)

- 1 Label the midpoint of the number line. Place the given decimal number at its proper location, and then round to the nearest **whole number**:

a $3.258 \approx$

b $65.8 \approx$

c $19.67 \approx$

- 2 Label the midpoint of the number line. Place the given decimal number at its proper location, and then round to the nearest **Tenth**:

a $0.65 \approx$

b $45.54 \approx$

c $3.992 \approx$

- 3 Label the midpoint of the number line. Place the given decimal number at its proper location, and then round to the nearest **Hundredth**:

a $6.357 \approx$

b $0.253 \approx$

c $9.999 \approx$

4 Round each of the following numbers:

- a $753.5 \approx$ (To the nearest whole number)
- b $56.25 \approx$ (To the nearest Tenth)
- c $63.78 \approx$ (To the nearest Ten)
- d $782.475 \approx$ (To the nearest Hundredth)
- e $956.285 \approx$ (To the nearest Hundred)
- f $0.0396 \approx$ (To the nearest Thousandth)

5 Fill in the chart as you round each decimal to the stated place value:

	Number	Round to the Nearest Whole Number	Round to the Nearest Tenth	Round to the Nearest Hundredth
a	56.284
b	572.089
c	0.896
d	50.101

Easy Numbers

The numbers (0, 0.5, and 1) are benchmark numbers.
Note the following number line:

0, 0.5, 1, 1.5, ... are called **benchmark numbers**.

► Estimating the Sum of Decimals Using Benchmark Numbers:

The sum of decimals can be estimated using benchmark numbers, as in the following problems:

a

$$0.65 + 0.456$$

↓ ↓
 $0.5 + 0.5 = 1$
0.65 is close to 0.5
0.456 is close to 0.5

b

$$0.001 + 0.98$$

↓ ↓
 $0 + 1 = 1$
0.001 is close to 0
0.98 is close to 1

c

$$0.55 + 0.9$$

↓ ↓
 $0.5 + 1 = 1.5$
0.55 is close to 0.5
0.9 is close to 1

Modeling Decimal Addition

First: Adding Decimals Using the Decimal Model:

Represent each of the two decimals with different colors, their sum is the number of squares of both colors.

Ex

a

$$0.65 + 0.8$$

b

$$0.45 + 0.14$$

3 Use the following decimal models to find the result:

a $0.23 + 0.15 = \dots\dots\dots$

b $0.68 + 0.75 = \dots\dots\dots$

c $0.08 + 0.8 = \dots\dots\dots$

d $0.85 + 0.78 = \dots\dots\dots$

4 Write an expression to match the models. Write an addition problem, and then find the result:

a $\dots\dots\dots + \dots\dots\dots = \dots\dots\dots$

b $\dots\dots\dots + \dots\dots\dots = \dots\dots\dots$

Second:

Adding Decimals Using the Place Value Chart:

Write the numbers in the place value chart and add.

Example: $0.375 + 0.28$

Subtracting Decimals – Estimating Decimal Differences – Subtracting to the Thousandths Place – Decimal Story Problems

Modeling Decimal Subtraction

First

Modeling Decimal Subtraction:

Represent the greatest decimal fraction on the model, and then remove the squares of the smaller decimal fraction:

Ex.

$$1.12 - 0.45$$

$$1.12 - 0.45 = 0.67$$

$$0.32 - 0.12$$

$$0.23 - 0.12 = 0.20$$

1 Use the decimal models to find the result:

a $0.28 - 0.15 =$

b $1.08 - 0.68 =$

c $0.58 - 0.4 =$

d $1.15 - 0.52 =$

- 2 Write an expression to match the models. Write a subtraction problem, and then find the result:

a $1.0 - 0.8 = 0.2$

b $1.0 - 0.2 = 0.8$

Second: Subtracting Decimals Using the Place Value Chart:

Write the numbers in the place value chart and then subtract.

Example: $24.8 - 7.245$

Whole Number						Decimal Point	Decimals		
Thousands			Ones						
Hundreds	Tens	Ones	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths
				2	4	.	8	0	0
					7	.	2	4	5
				1	7	.	5	5	5

So, $24.8 - 7.245 = 17.555$

- 3 Use the place value table to find the difference:

a $12.8 - 3.09 =$

Variable	Expression	Equation
It's a letter or symbol that represents the unknown value in an equation. Such as: x, y, z, \dots	It's a set of fixed numbers and variables that line up next to each other. Such as: $x + 5, 3 \times y$	It's a mathematical sentence that includes an equal relationship between two mathematical expressions. Such as: $5 + x = 9, y = 5 \times 3$

- 1 Put a tick (✓) to classify the following mathematical sentences into “Equation” or Mathematical Expression” or “Other”:

		Equation	Mathematical Expression	Other
a	$4.7 + 3.6 = M$
b	$6.4 + 3.2 + 8$
c	$56 - x = 47.5$
d	$3.4 + L$
e	Aya ran 8 km last week.
f	$3.5 + 2.456 = 2.5 + 3.456$
g	$37.125 - 13.7$

Using Letters or Symbols to Represent Unknown Values in Mathematical Expressions and Equations

Example:

Yassin bought a pen and a ruler. He paid **14.5** pounds for them. If the price of the pen is **6.25** pounds, what is the price of the ruler?

Write an equation to represent the price of the ruler.

The previous example can be expressed as follows:

- Replace the word unknown with one of the letters (a variable) "y".
- **So, the equation that represents the price of the ruler is:**

$$6.25 + y = 14.5 \quad \text{or} \quad y = 14.5 - 6.25$$

2 Read the following story problems. Make an equation for each problem:

- A class in a school has **45** students. **28** of them are girls.
How many boys are there in this class?

How much did Ahmed spend to buy the car and the house?

Determining the Value of the Unknown

You can use mental math to determine the value of the (unknown) variable in the equation.

Example: Find the value of (a) in each of the following:

a

$$2.5 + a = 7.75$$

$$a = 7.75 - 2.5 = 5.25$$

b

$$12.7 - a = 9.7$$

$$a = 12.7 - 9.7 = 3$$

c

$$a - 3.7 = 4.68$$

$$a = 3.7 + 4.68 = 8.38$$

1 Use mental math to estimate the equations, and then solve them:

Lesson 10

Factors or Multiples?

The Difference Between Factors and Multiples

Factors

Factors of a number

Are all pairs whose products are multiplied together to give this number.

- Not all numbers have the same number of factors.
- When a number is divided evenly, it is divided into factors.
- One of the factors can be obtained by dividing the multiple by the other factor.

Multiples

Multiples of a number

Are the setting that appears when jumping by the same number, starting from zero.

- All numbers have an **infinite** number of **multiples**.
- The **multiplier** is the product of two factors.
- Multiples can be found by multiplying the factors.

Story Problems

GCF

Usually involves breaking or cutting things into pieces or separating them into multiple groups.

LCM

Usually involves repetition, or two things happening at the same time.

Note the following two examples:

Example (1):

Omnia has **two** strips of cloth. One is **35** cm wide, and the other is **75** cm wide. She wants to cut both pieces into strips of equal width that are as wide as possible. How wide should she cut the strips?

(In this example, Omnia wants to divide the cloth into pieces, so we use the GCF in the solution)

Solution: $35 = 5 \times 7$

$75 = 5 \times 5 \times 3$

GCF = 5

The largest width of the strips = 5 cm.

Example (2):

Mohamed trains to walk every 7 days and lift weights every 4 days, he did both today. After how many days will Mohamed walk and lift weights on the same day?

(In this example, there is a repetition of what Mohamed does, so we use the LCM in the solution)

Solution: Multiples of 7: 0, 7, 14, 21, 28, 35, 42,

Multiples of 4: 0, 4, 8, 12, 16, 20, 24, 28, 32

LCM = 28

Mohamed will do both exercises after 28 days.

- 1 Omar exercises every 12 days. Rana exercises every 8 days. Both friends exercised together today. How many days will it be until they exercise together again?

 45 \times 38 &= (40 + 5) \times (30 + 8) \\
 &= (40 \times 30) + (40 \times 8) + (5 \times 30) + (5 \times 8) \\

Example (2): 69×427

$$\begin{aligned}
 69 \times 427 &= (60 + 9) \times (400 + 20 + 7) \\

Flexible Numbers

Note that when multiplying the two numbers 83×14 ,
 83 and 14 can be divided using **more than one** method.

Examples:

a $83 \times 14 = (80 + 3) \times (10 + 4)$

	10	4
80	800	320
3	30	12

$800 + 320 + 30 + 12 = 1,162$

b $83 \times 14 = (40 + 40 + 3) \times (10 + 4)$

	10	4
40	400	160
40	400	160
3	30	12

$400 + 160 + 400 + 160 + 30 + 12 = 1,162$

c $83 \times 14 = (80 + 3) \times (7 + 7)$

	7	7
80	560	560
3	21	21

$560 + 560 + 21 + 21 = 1,162$

d $83 \times 14 = (50 + 30 + 3) \times (7 + 7)$

	7	7
50	350	350
30	210	210
3	21	21

$350 + 350 + 210 + 210 + 21 + 21 = 1,162$

From the above, we find that all methods of dividing numbers
lead to the same result.

$$8 \times 23 = (8 \times 20) + (8 \times 3)$$

$$= 160 + 24 = 164$$

$$= 1,500 + 30 + 9 = 1,539$$

c 37×64

	60	4
30	1,800	120
7	420	28

$$37 \times 64 = (30 \times 60) + (30 \times 4) + (7 \times 60) + (7 \times 4)$$

Understanding Division Using the Area Model to Divide

Learning Objectives:

By the end of these lessons, the student will be able to:

- Use story problems to explain the meaning of division problems.
- Use the area model to solve division problems.

Using the Partial Quotients Model to Divide Estimating Quotients

Learning Objectives:

By the end of these lessons, the student will be able to:

- Use the partial quotients model to solve division problems.
- Use estimation to check the reasonableness of his/her answers.

Lessons 1&2

Understanding Division Using the Area Model to Divide

Remember

Division: It means dividing a certain quantity into **equal** groups, which is the **opposite** of multiplication.

Ex $36 \div 9 = 4$ & $39 \div 9 = 4$ (R 3) Because: $4 \times 9 = 36$

Dividend Divisor Quotient Remainder

Here are three word problems to be read carefully:

There are **72** students at the playground. We need to divide the students into teams, so that each team includes **9** students. How many teams can be formed?

Solution:

$$72 \div 9 = 8 \text{ teams.}$$

There are **72** students at the playground. We need to divide the students into **8** teams. How many students are there in each team?

Solution:

$$72 \div 8 = 9 \text{ students.}$$

There are **8** teams playing football, and each team has **9** players. How many students are there in each team?

Solution:

$$8 \times 9 = 72 \text{ students.}$$

From the above, we note that:

- The numbers are the **same**, and the problems are all about equal teams.
However, you can use different operations to solve each of these problems.
- Multiplication:** things are already in equal groups.
- Division:** things must be divided into equal groups.

1 Answer the following:

- a If 18 plums are divided equally into 3 bags, then how many plums will be in each bag?
- b 18 plums are packed in bags. If each 3 plums are put in a bag, how many bags are there?
- c If each bag contains 6 plums, and we have 3 bags, how many plums are there?

Division Strategies

The quotient can be found in different ways

Area Model

Partial Quotients Model

Standard Algorithm

Remember

Using the Area Model to Divide

Example: Divide: $753 \div 6$

Draw a rectangle and write the divisor (6) on the left side of the rectangle. The quotient will be between 200 and 300.

(1) – We look for a multiple of 6, close to 753.

– We find that 600 is a multiple of 6; because $600 = 6 \times 100$.

– We write 100 over one part of the rectangle,

and we write $753 - 600 = 153$ inside it.

(2) – We look for a multiple of 6, close to 153.

– We find that 120 is a multiple of 6;
because $120 = 6 \times 20$.

– We write 20 over another part of the rectangle, and we write
 $153 - 120 = 33$ inside it.

(3) – We look for a multiple of 6, close to 33.

– We find that 30 is a multiple of 6;
because $30 = 6 \times 5$.

– We write 5 over another part of the rectangle, and we write $33 - 30 = 3$
inside it.

$$753 \div 6 = 125 \text{ (R 3)}$$

The remainder (3) is less than the divisor (6), so the division process is completed.

To find the quotient, we add the numbers above the rectangle:
 $100 + 20 + 5 = 125$

Note that

There is more than one way to use the area model to solve division problems, as in the following:

$$753 \div 6 = 125 \text{ (R 3)}$$

2 Divide using the area model:

a $763 \div 5$

b $4,527 \div 9$

c $6,820 \div 5$

Learn

Dividing by a Two-Digit Number Using the Area Model

Example: Divide: $1,625 \div 13$

We follow the same steps for dividing by a one-digit number:

(1) We look for a multiple of 13, close to the divisor 1,625.

(2) We find that $100 \times 13 = 1,300$.

(3) We write 100 over one part of the rectangle, and we write $1,625 - 1,300 = 325$ inside it.

$100 + 20 + 5 = 125$		
1,625	325	65
$- 1,300$	$- 260$	$- 65$
325	65	0

Quotient 125
Remainder 0

$1,625 \div 13 = 125$

Another Solution

$100 + 10 + 10 + 5 = 125$			
1,625	325	195	65
$- 1,300$	$- 130$	$- 130$	$- 65$
325	195	65	0

Quotient 125
Remainder 0

$1,625 \div 13 = 125$

• We repeat the **same steps** with the rest of the number.

Note that There is more than one way to use the area model to solve division problems, as in the following example:

Example:

Divide: $10,454 \div 24$

$$\begin{array}{r}
 400 + 30 + 5 = 435 \\
 \begin{array}{r|l}
 10,454 & 854 \quad 134 \\
 - 9,600 & - 20 \quad - 120 \\
 \hline
 854 & 134 \quad 14
 \end{array} \\
 10,454 \div 24 = 435 \text{ (R } 14\text{)}
 \end{array}$$

Another Solution

$$\begin{array}{r}
 100 + 100 + 100 + 100 + 10 + 10 + 10 + 5 = 435 \\
 \begin{array}{r|l}
 10,454 & 8,054 \quad 5,654 \quad 3,254 \quad 854 \quad 614 \quad 374 \quad 134 \\
 - 2,400 & - 2,400 \quad - 2,400 \quad - 2,400 \quad - 240 \quad - 240 \quad - 240 \quad - 120 \\
 \hline
 8,054 & 5,654 \quad 3,254 \quad 854 \quad 614 \quad 374 \quad 134 \quad 14
 \end{array} \\
 10,454 \div 24 = 435 \text{ (R } 14\text{)}
 \end{array}$$

b $16,848 \div 27$

4 Complete the area model, then find the quotient:

 - 6,400 & - 1,280 \quad - 96 \\
 \hline
 1,376 & 96 \quad 14
 \end{array}$$

$\dots + \dots + \dots + \dots = \dots$

b $9,234 \div 81$

$$\begin{array}{r|l}

(1) We write the division process as shown.

• The remaining number (**3**) is less than the divisor (**6**).

Thus, the division process is completed.

• To find the quotient, we add the numbers on the right: **$100 + 20 + 5 = 125$** .

So, $753 \div 6 = 125$ (R 3)

Note that

There is more than one way to use the partial quotients model to solve division problems.

Dividing by a Two-Digit Number Using the Partial Quotients Model

Example: Divide: $3,559 \div 14$

We follow the same steps for dividing by a one-digit number:

- We look for a multiple of 14, close to the divisor 3,559.
- We find that $200 \times 14 = 2,800$.
- We write 200 on the right and subtract $3,559 - 2,800 = 759$.
- We repeat the same steps with the rest of the number.

So, $3,559 \div 14 = 254 \text{ (R 3)}$

Notes

Estimating Quotients:

- We use estimation when we want to get an answer **close** to the actual result.

To estimate the quotient, we use **compatible numbers**:

- The estimate is close to the actual product when both numbers are close to the **two rounded numbers**, or when the two numbers are rounded in the same direction.

Ex $12,192 \div 24 = 508$ and the estimate is $10,000 \div 20 = 500$

- The estimate is far from the actual result when a number is rounded **up** and another number is rounded **down**.

Ex $27,032 \div 62 = 436$ and the estimate is $30,000 \div 60 = 500$

4 Estimate the quotient, then find the actual result. Use the strategy you prefer:

Learning Objectives:

By the end of these lessons, the student will be able to:

- Use the standard algorithm to divide by a 2-digit divisor.
- Use multiplication to check answers to division problems.
- Solve multistep story problems involving whole numbers and the four operations.

Lessons 5-7

Using the Standard Algorithm to Divide Checking Division with Multiplication Multistep Story Problems

Remember

Using the Standard Algorithm to Divide

Example: Divide: $891 \div 3$

The steps of the division process:

First Step:
Divide

$$\begin{array}{r} 2 \\ 3 \overline{) 891} \\ \underline{6} \\ 29 \end{array}$$

Second Step:
Multiply

$$\begin{array}{r} 2 \\ 3 \overline{) 891} \\ \underline{6} \\ 29 \end{array}$$

Third Step:
Subtract

$$\begin{array}{r} 2 \\ 3 \overline{) 891} \\ \underline{6} \\ 29 \\ \underline{27} \\ 21 \end{array}$$

Fourth Step:
Drop the next digit

$$\begin{array}{r} 2 \\ 3 \overline{) 891} \\ \underline{6} \\ 29 \\ \underline{27} \\ 21 \end{array}$$

We repeat the same steps

Divide: $29 \div 3$

Multiply: 9×3

Subtract: $29 - 27$

Drop the digit: 1

$$\begin{array}{r} 29 \\ 3 \overline{) 891} \\ \underline{6} \\ 29 \\ \underline{27} \\ 21 \end{array}$$

Divide: $21 \div 3$

Multiply: 7×3

Subtract: $21 - 21$

$$\begin{array}{r} 297 \\ 3 \overline{) 891} \\ \underline{6} \\ 29 \\ \underline{27} \\ 21 \\ \underline{21} \\ 0 \end{array}$$

So, $891 \div 3 = 297$

Note that

Multiplication and division are **inverse operations**, so we can use multiplication to check the result of division.

From the previous example:

$297 \times 3 = 891$, where the product of multiplication is equal to the divisor, so the quotient is true.

Example:

Divide: $859 \div 8$

(Using the standard division algorithm)

- Note that:** When dividing $5 \div 8$, division is **not possible** because $5 < 8$.

So: We put **0** over the digit **5**, and we divide **5** and **9** together: $59 \div 8$.

Thus: $859 \div 8 = 107 \text{ (R 3)}$

Check: $(107 \times 8) + 3 = 859$

Diagram illustrating the division process for $859 \div 8$:

At the top, a box shows $5 \div 8$ with the text "Not possible".

Below this, a box shows $8 \div 8 = 1$ and $56 \div 8 = 7$.

The main division is shown as:

$$\begin{array}{r} 107 \\ 8 \overline{) 859} \\ \underline{800} \\ 59 \\ \underline{56} \\ 3 \end{array}$$

Annotations include:

- $8 \times 100 \rightarrow - 800$
- $8 \times 7 \rightarrow - 56$

Learn

Dividing by a Two-Digit Number Using the Standard Division Algorithm

Create a **multiplication table** for the divisor to help you:

$$46 \times 1 = 46$$

$$46 \times 2 = 92$$

$$46 \times 3 = 138$$

$$46 \times 4 = 184$$

$$46 \times 5 = 230$$

$$46 \times 7 = 322$$

Starting from the left, we find that:

$9 < 46$, so we divide $99 \div 46$.

With the help of the previous table, **we find that:**

The nearest multiple of 46 to 99 is $46 \times 2 = 92$.

$$\begin{array}{r} 0217 \\ 46 \overline{) 9982} \\ \underline{- 92} \\ 78 \end{array}$$

2

$$\begin{array}{r} 0217 \\ 46 \overline{) 9982} \\ \underline{- 92} \\ 78 \\ \underline{- 46} \\ 322 \end{array}$$

So: $9,982 \div 46 = 217$

Check: $217 \times 46 = 9,982$

3

$$\begin{array}{r} 0217 \\ 46 \overline{) 9982} \\ \underline{- 92} \\ 78 \\ \underline{- 46} \\ 322 \\ \underline{- 322} \\ 000 \end{array}$$

► In another way:

When multiplying a whole number by a decimal, we do the multiplication **without** the decimal point and then put the decimal point while maintaining the same number of **decimal parts**.

Ex. When multiplying:
 23×0.09

- ① We multiply: $23 \times 9 = 207$
- ② Then we put the decimal point after **two** digits (2.09).

So, $23 \times 0.09 = 2.07$

Metric Conversions with Multiplication and Division

Note

Multiplying by (0.1, 0.01, 0.001 ...) is equivalent to Dividing by (10, 100, 1.00 ...)
 $2.5 \times 0.1 = 0.25$, $2.5 \div 10 = 0.25$ $2.5 \times 0.1 = 2.5 \div 10 = 0.25$

Multiplying by (10, 100, 1.00 ...) is equivalent to Dividing by (0.1, 0.01, 0.001 ...)
 $2.5 \times 10 = 25$, $2.5 \div 0.1 = 25$ $2.5 \times 10 = 2.5 \div 0.1 = 25$

From the above, we find that:

- When converting from one measurement unit to another, you can use multiplication or division.

Note the corresponding figure:

- To convert from meters to centimeters, you can multiply by **100** or divide by **0.01**.
- To convert from centimeters to meters, you can multiply by **0.01** or divide by **100**.

- 4 Complete each **conversion**. Then, write a **multiplication equation** and a **division equation** with the same answer:

Ex 45 mm = **4.5** cm.

$45 \times 0.1 = 4.5$

$45 \div 10 = 4.5$

a 4.65 m = cm.

$4.65 \times \dots = \dots$

$4.65 \div \dots = \dots$

b 5.6 kg = gm.

$5.6 \times \dots = \dots$

$5.6 \div \dots = \dots$

c 42 dm = cm.

$42 \times \dots = \dots$

$42 \div \dots = \dots$

d 0.02 l = ml.

$0.02 \times \dots = \dots$

Modeling Decimal Division

Example (1): Divide: $2.4 \div 0.4$

Note the corresponding figure, where each column represents **0.1**.

- **2.4** consists of two squares, each consisting of **10** columns, in addition to **4** other columns (**24** columns).
- **0.4** is **4** columns.
- Dividing **2.4** by **0.4** means how many groups of **0.4** by **2.4**.
- We find that there are **6** groups, each consisting of **4** columns (**0.4**), ($24 \div 4 = 6$).

So, $2.4 \div 0.4 = 6$

Example (2): Divide: $1.4 \div 0.35$

Note the corresponding figure,
where each square
represents **0.01**.

- **1.4** is a square consisting of **100** squares in addition to **40** other squares (**140** columns).

- **0.35** is **35** squares.
- Dividing **1.4** by **0.35** means how many groups of **0.35** by **1.4**.
- We find that there are **4** groups, each consisting of **35** squares (**0.35**), (**$140 \div 35 = 4$**).

So, $1.4 \div 0.35 = 4$

5 Use the Base 10 blocks to model the following problems:

a $1.8 \div 0.3 = \dots\dots\dots$

b $2.7 \div 0.9 = \dots\dots\dots$

 Solving Challenging Multistep Story Problems

Learn

Estimating Decimal Quotients

Example: Estimate: $45.64 \div 6.87$

Round the dividend to the nearest compatible whole number (a number that is divisible by the divisor after rounding).

The number **45.64** lies between **42** and **49**.

$$45.64 \div 6.87$$

Round the divisor to the nearest whole number:
 $6.87 \approx 7$

If you use **42**, the estimate will be of a lower value: $42 \div 7 = 6$.

If you use **49**, the estimate will be of a larger value: $49 \div 7 = 7$.

1 Estimate the **decimal quotients** in each of the following:

a $31.79 \div 9.35$

Estimate \div = or \div =

b $22.12 \div 4.98$

Estimate \div = or \div =

c $10.17 \div 3.25$

c	Each floor of the building needs 28.3 meters of plastic piping. The team has a total of 314.58 m of piping. How many floors can they fit with the piping?
d	Each steel joist can support 224.6 kilograms of weight. How much weight can 10 steel joists support?

Learn

Dividing Decimals by Whole Numbers

- Assume that the two numbers are **whole numbers** and do the division.
- Put the decimal point in the result in the same position as the **dividend**.

Examples: Divide:

a $273.6 \div 8 = 34.2$

$$\begin{array}{r}
 034.2 \\
 8 \overline{) 273.6} \\
 \underline{- 24} \\
 33 \\
 \underline{- 32} \\
 16 \\
 \underline{- 16} \\

 \end{array}$$

b $281.76 \div 12 = 23.48$

$$\begin{array}{r}
 023.48 \\
 12 \overline{) 281.76} \\
 \underline{- 24} \\
 41 \\
 \underline{- 36} \\
 57 \\
 \underline{- 48} \\
 96 \\
 \underline{- 96} \\
 00
 \end{array}$$

c $71.872 \div 32 = 2.246$

$$\begin{array}{r}

 32 \overline{) 71.872} \\
 \underline{- 64} \\
 78 \\
 \underline{- 64} \\
 147 \\
 \underline{- 128} \\
 192 \\
 \underline{- 192} \\
 0
 \end{array}$$

Dividing Decimals by Decimals

- Convert the divisor into a whole number: by moving the decimal point to the **right** (by multiplying by 10, 100, or 1,000...) according to the number of decimal places in the **divisor**.
- Move the decimal point to the **right** in the dividend by the same number of digits moved in the divisor.
- You may need to add **zeros** to the right of the divisor sometimes.
- Perform the division operation.

Examples: Divide:

a $17.01 \div 0.7 = 24.3$

$$\begin{array}{r} \downarrow \times 10 \quad \downarrow \times 10 \\ 170.1 \div 7 \\ \hline 024.3 \\ 7 \overline{) 170.1} \\ \underline{- 14} \\ 30 \\ \underline{- 28} \\ 21 \\ \underline{- 21} \\ 0 \end{array}$$

b $8.4 \div 0.24 = 35$

$$\begin{array}{r} \times 100 \quad \times 100 \\ 840 \div 24 \\ \hline 035 \\ 24 \overline{) 840} \\ \underline{- 72} \\ 120 \\ \underline{- 120} \\ 0 \end{array}$$

c $2.4 \div 0.025 = 96$

$$\begin{array}{r} \downarrow \times 1,000 \quad \downarrow \times 1,000 \\ 2,400 \div 25 \\ \hline 0096 \\ 25 \overline{) 2,400} \\ \underline{- 25} \\ 150 \\ \underline{- 150} \\ 000 \end{array}$$

Notes

Sometimes we may need to add a decimal point and an addition to complete the division process, as in the following examples:

1 When dividing $456 \div 12$, the quotient is **38** and the remainder is **6**, so we add the decimal point and 0 to the dividend to complete the division ($456 \div 12 = 38.5$).

2 When dividing $97 \div 4$, the quotient is **24** and the remainder is **1**, so we add the decimal point and 0 to the dividend twice to complete the division ($97 \div 4 = 24.25$).

1

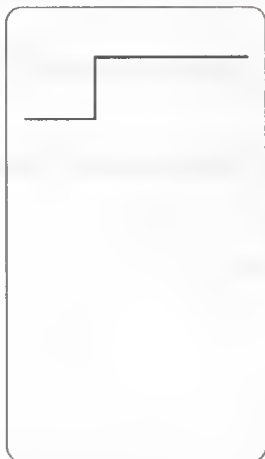

$$\begin{array}{r} 038.5 \\ 12 \overline{) 462.0} \\ \underline{- 36} \\ 102 \\ \underline{- 96} \\ 60 \\ \underline{- 60} \\ 0 \end{array}$$

2

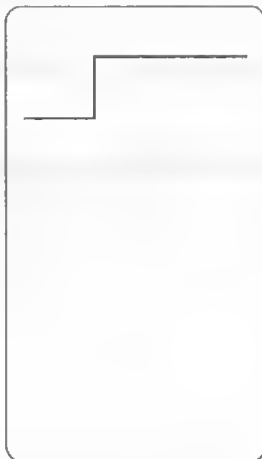

$$\begin{array}{r} 24.25 \\ 4 \overline{) 97.00} \\ \underline{- 8} \\ 17 \\ \underline{- 16} \\ 10 \\ \underline{- 8} \\ 20 \\ \underline{- 20} \\ 0 \end{array}$$

Writing Expressions to Represent Scenarios

Note the following mathematical expressions:

Add 6.4 and 2.7

$$6.4 + 2.7$$

Subtract 2.4 from 8.2

$$8.2 - 2.4$$

Multiply 9.2 by 0.1

$$9.2 \times 0.1$$

Divide 83.2 by 6.7

$$83.2 \div 6.7$$

Example: Write an expression that matches the clues. Then, evaluate the expression:

Subtract 3.5 from 7.2 and divide the result by 10

Parentheses are used if the first operation is subtraction or addition.

$$(7.2 - 3.5) \div 10 = 3.7 \div 10 = 0.37$$

Multiply 2.5 by 0.1 and add 3.2

No parentheses are needed if the first operation is multiplication or division.

$$(2.5 \times 0.1) + 3.2 = 0.25 + 3.2 = 3.45$$

Multiply 217 by 0.01 and subtract the result from 4.8, then divide by 10

$$(4.8 - 217 \times 0.01) \div 10 = (4.8 - 2.17) \div 10 = 2.63 \div 10 = 0.263$$

Parentheses are placed to perform subtraction before division, and parentheses are not placed for multiplication because it is natural that it is performed first.

Numerical Pattern

It is a sequence of numbers according to a certain rule.

Pattern rule: is the relationship between the number and the number **before** it.

Example: Note the following patterns:

3 , 6 , 9 , 12 , 15 , 18 , 21 ,

(Arrows show +3 between consecutive numbers)

Each number = the previous number + 3

The pattern rule is: $n+3$ (the variable n represents the previous number)

2 , 4 , 8 , 16 , 32 , 64 , 128 ,

(Arrows show X2 between consecutive numbers)

Each number = the previous number X 2

The pattern rule is: $n \times 2$ (the variable n represents the previous number)

1 Write the **rule** for each pattern with a variable. Then, complete the pattern by finding the missing **values**:
